# Title: Advanced Log Analysis using SIEM

## 1. Objective

To analyze system logs, detect anomalies, and enrich log data for identifying suspicious activities.

---

## 2. Log Correlation

| Timestamp | Event ID | Source IP | Destination | Observation |
|---|---|---|---|---|
| 2026-03-30 22:19:43 | 404 | 234.62.171.130 | artifacts.elastic.co | Repeated failed HTTP requests |
| 2026-03-30 21:34:31 | 404 | 191.105.163.245 | artifacts.elastic.co | Possible reconnaissance attempt |

**Insight:**
Repeated HTTP errors indicate scanning or probing behavior.

---

## 3. Anomaly Detection

- Detection rule created for HTTP error spikes
- Observed repeated failed requests from same IP
- Indicates abnormal traffic pattern

---

## 4. Log Enrichment (GeoIP)

- Source Location: United States
- Destination: India

Helps identify suspicious foreign access attempts.

---

## 5. Summary (50 Words)

Log analysis revealed repeated HTTP error responses from external IPs, indicating possible reconnaissance attempts. GeoIP enrichment showed traffic originating from foreign regions targeting internal systems. Detection rules helped identify abnormal patterns, enhancing visibility into suspicious activities and improving threat detection capabilities.
